

In my 66 years of being a Ham Operator, I have never known of a power company who cared the least bit about their interference to my HF radios. You guys can't be serious about letting them add even more interference to the already massive interference they already cause. Try listening to AM talk radio along a power line. Where are your enforcement people in this case? At this very moment I have power line interference that makes my FCC LICENSED HAM RADIO, W4FDA, nearly unusable in the direction to Europe. It's all about the money and power. It stinks.
